**Sector:** grades 6-12

## Abstract

This program is a set of 12 lessons for grades 6-8 and set of 12 lessons for grades 9-12 showing how mathematical processes and concepts may be applied in the study of economics and personal finance. In these volumes educators will find lessons connecting mathematics instruction to practical problems and issues that students will encounter through their lifetime.

The lessons presented in the volumes are not designed exclusively for college-bound students. Several of them are intended to serve a general education purpose, providing knowledge and skills that students will use subsequently as savers, investors, consumers, producers, and informed citizens.
